

Custom Transportation Solutions

Guilford Group has developed solutions for an intermodal transportation giant that operates the largest rail network in the eastern United States. This company provides truck and rail transportation services across the United States and into key markets in Canada and Mexico. It and its subsidiaries also perform maritime operations, including an international terminal services company. Guilford Group has created a variety of tier 1 and tier 2 applications to support their business.

Online Brokerage

Powerfinder is a web based system that facilitates the process to provide different moves to various vendors and selects the best choice determined by price and service. This Java application allows an agent to tender a load to a group of vendors in a defined geographic area. Powerfinder is integrated with the rating engine and dispatch so the load and relevant details can be viewed and either accepted or declined by their partner carriers.

Yard Configurator

The YardConfig is a parking configuration application designed to optimize and manage the dynamic parking configurations of equipment in the rail yard. This rules based system manages multiple types of equipment for a variety of partners.

Driver Settlement

This application allows drivers to print paperwork from a mobile device to a printer located at the ramp where they work. The driver can submit all paperwork required for daily settlement electronically. With all the information being captured, verified and system-generated, it greatly reduces errors and expedites the end of a driver's day. The information is indexed and automatically associated with the required PODs, Bills of Lading, Assessorial, etc. all relating to a specific move. Each driver in the fleet will save approximately 40 hours per year with the automation of the driver settlement process.
